NOTES ON REVISION DATED 1-5-96

This revision of the Commuter Rail Book of Standard Plans - Track and Roadway, dated January 5, 1996 revises a total of 28 existing plans and adds 4 new drawings. Plan holders of existing Book of Standard Plans current to the revision dated 10-28-92 are hereby directed to replace the existing index and revised plans as noted on the attached summary of plans revised and add the four new drawings in proper numerical order.

In addition to minor corrections and additions, the revisions to turnouts are primarily concerned with adding 1:80 cant transition tie plates between the flat plates in the switch and frog area and the standard 1:40 cant plates used in the closure area and either side of the turnout as well as revisions to the swivel shoulder tie plates used in the frog area. A longer 35" swivel shoulder plate has been added and the schedule of other plates revised.

A new drawing for the 1:80 transition plates has been added as well as three new drawings for a number 8 double slip switch. The double slip switch plans are generic in nature, defining only the basic layout and dimensions of major components to facilitate standardization of components for replacement.

There are still two turnout designs in the standards. The original design which uses solid heel blocks is retained. There are also floating heel block designs with 60 foot undercut stock rails and bonded insulated joint plug rails for the number 10, 15, & 20 turnouts. These turnouts are identified as "Floating Heel Block" turnouts to distinguish them from the original design. Unless otherwise specified, the floating heel block turnouts shall be furnished with any new orders. The original design of 1986 will be used only for replacement of material or certain specific applications when approved by Railroad Operations.

Many of the turnout detail plans such as vertical switch rods, switch plates and frogs are common to both turnout designs. The original plans for those elements have been modified to allow their use with either design.

As an aid to finding the various turnouts, an explanation of the plan numbering system may be helpful. Special trackwork and related material are numbered in the 2000 series. The two middle numbers denote the frog number of the original design turnout: that is, 2080, 2100, 2150 and 2200 number series are for number 8, 10, 15 & 20 turnouts respectively. The newer design, which is a revision of the original, adds one to the middle number so that 2110, 2160, 2210 number series indicates the new design for number 10, 15, & 20 turnouts. As noted in the paragraph above, the plans of details such as switch plates, switch rods and frogs are common to both turnout designs.

MASSACHUSETTS BAY TRANSPORTATION AUTHORITY
BOOK OF STANDARD PLANS - TRACK AND ROADWAY

PLANS REVISED IN APRIL 29, 1996 REVISION

REVISED STANDARD PLANS

1030 - Asphalt Underlayment at Turnouts
1110 - Headblock Tie Layout & Dapping Details
2200 - No. 20 Turnout - Bill of Material
2202 - No. 20 Welded Turnout Tie and Rail Layout
2203 - No. 20 Equilateral Turnout Tie and Rail Layout
2204 - No. 20 Crossover Tie and Rail Layout
2205 - 39'-0" Curved Split Switch
2209 - Typical Power Switch Layout with Helper
2210 - No. 20 Turnout with Floating Heel Blocks - Bill of Material
2212 - No. 20 Turnout with Floating Heel Blocks - Tie & Rail Layout
2215 - 39' Curved Split Switch with Floating Heel Blocks

Above plans have been revised to change two elements of the number 20 turnouts as follows:

- Changed headblock timbers on number 20 turnouts from 12' long to 14' long. The added length will allow fastening the switch helper mechanism used on the 39' switches further in from the end of the headblock.

- Added four 17'- 0" switch timbers at heel end of turnout to allow placing concrete ties at end of turnout without interlacing or re-spacing of ties. Note: If Oak switch timbers are used rather than tropical hardwood (Azobe), transition ties should be used between last long timber of turnout and and concrete ties.

To make your Book of Standard Plans current, please replace the above plans as well as the entire Plan Index with the revised index attached and dated April 29, 1996

There are still two turnout designs in the standards. The original design which uses solid heel blocks is retained. There are also floating heel block designs with 60 foot undercut stock rails and bonded insulated joint plug rails for the number 10, 15, & 20 turnouts. These turnouts are identified as "Floating Heel Block" turnouts to distinguish them from the original design. Unless otherwise specified, the floating heel block turnouts shall be furnished with any new orders. The original design of 1986 will be used only for replacement of material or certain specific applications when approved by Railroad Operations.

Many of the turnout detail plans such as vertical switch rods, switch plates and frogs are common to both turnout designs. The original plans for those elements have been modified to allow their use with either design.

As an aid to finding the various turnouts, an explanation of the plan numbering system may be helpful. Special track work and related material are numbered in the 2000 series. The two middle numbers denote the frog number of the original design turnout: that is, 2080, 2100, 2150 and 2200 number series are for number 8, 10, 15 & 20 turnouts respectively. The newer design, which is a revision of the original, adds one to the middle number so that 2110, 2160, 2210 number series indicates the new design for number 10, 15, & 20 turnouts. As noted in the paragraph above, the plans of details such as switch plates, switch rods and frogs are common to both turnout designs.

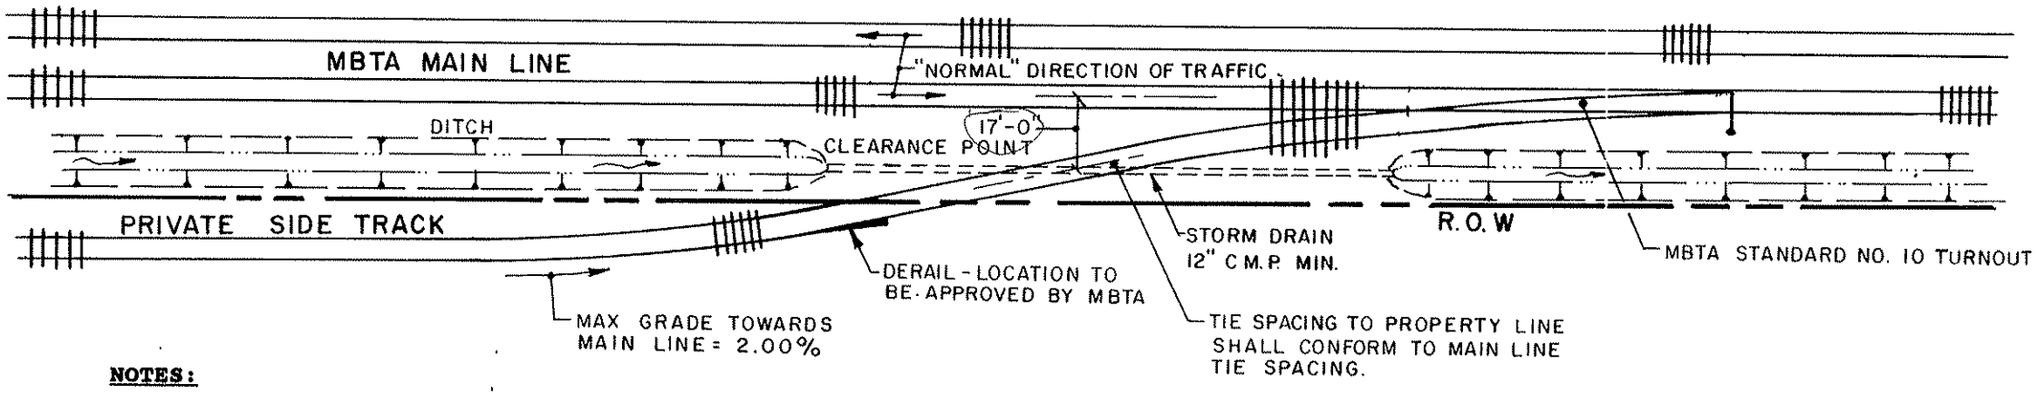
John J. Williams
ENGINEERING OFFICER

CHIEF ENGINEERING OFFICER



NOTES:

1. Turnout (T.O.) shall be 132 RE, welded, resiliently fastened per MBTA current standard with Hot Mixed Asphalt to be installed under all main line T.O.'s as per plan 1030.

2. No relay rail will be permitted on MBTA property, except with the express written permission of the MBTA and under no circumstances shall the rail differ from the main line rail in weight or section.

3. All T.O.'s shall be trailing point (as depicted) with respect to normal traffic direction unless otherwise permitted with the express written authorization from the MBTA.

4. MBTA forces (or their designee) shall perform all T.O. installation and trackwork on MBTA property to the property line.

5. In territory with concrete ties, those serviced by the sidetrack shall be responsible for the costs of removal of the concrete ties and additional Transition ties to maintain track integrity.

6. Sidetracks which slope down toward the main line shall not exceed a 2% grade (2ft. vertical per 100ft. linear).

7. Any sidetrack sloping toward the main line shall be equiped with a Split Switch Derail with installation and maintenance of the Derail the responsiblity of those serviced by the Sidetrack unless otherwise approved. Location of the Derail subject to MBTA approval.

8. Under no cicumstances shall railroad cars or other equipment encroach beyond the clearance point and should clearance point be on MBTA property. No car or equipment shall be allowed to stand between the property line and the clearance point without the express written permission of the MBTA.

9. Unattended derails shall be kept locked at all times in the normal position (Derail "on") if the sidetrack is occupied by railroad cars.

10. Additional structures, such as bollards, may be necessary to protect the main line and the cost of these additional structures shall be borne by those serviced by the sidetrack.

11. The maximum curvature (calculated by chord definition) on sidetracks shall be a degree of curve not exceeding 12°30' unless otherwise allowed by the designated freight railroad servicing the sidetrack but in no case on MBTA property shall the degree of curve exceed 12°30'.

12. Existing drainage patterns shall be maintained (where necessary) by the installation of a pipe (12" min.) to facilitate drainage flow across Sidetrack area. Pipe shall have a flow capacity equal to the ditch and shall be reviewed by the MBTA on a site specific basis. Pipe shall be designed for railroad loadings (E-80) at expected depth below bottom of tie.

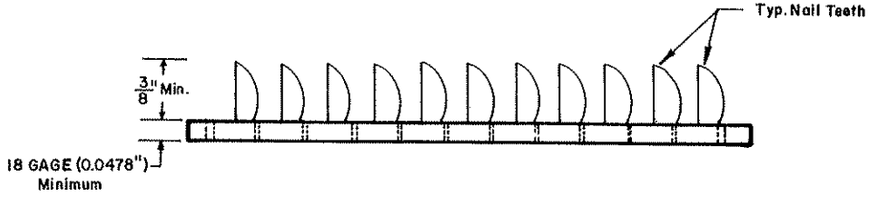
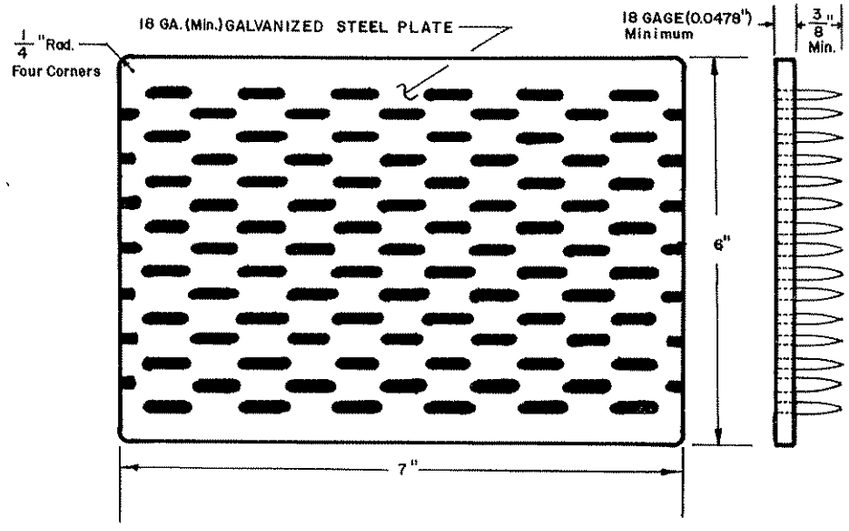
TYPICAL TIE END VIEW





TYPICAL ANTI – SPLITTING END PLATE

NOTES:

1. The Anti-Splitting End Plate (ASEP) shall be manufactured from a minimum 18 Ga. (0.0478") galvanized steel plate, hot dipped.

2. The ASEP shall have nail teeth not less than 3/8" in length and of sufficient sharpness to fully penetrate hardwood timbers used for cross ties.

3. The ASEP shall be machine applied to the ends of a tie with uniform pressure and minimum teeth bending and shall be applied so that the nail teeth side ofthe plate is flush with end surface of the tie.

4. The ASEP is to be applied to new ties prior to seasoning.

5. The center of the ASEP is to be applied not more than 1/2" off the horizontal and vertical centerline intersections of the tie end.

6. The ASEP shall be fabricated in such a way that the teeth twist vertically to allow a better grip in the tie.

7. Mark and install plates to indicate location of Heartwood (KERF Marks).

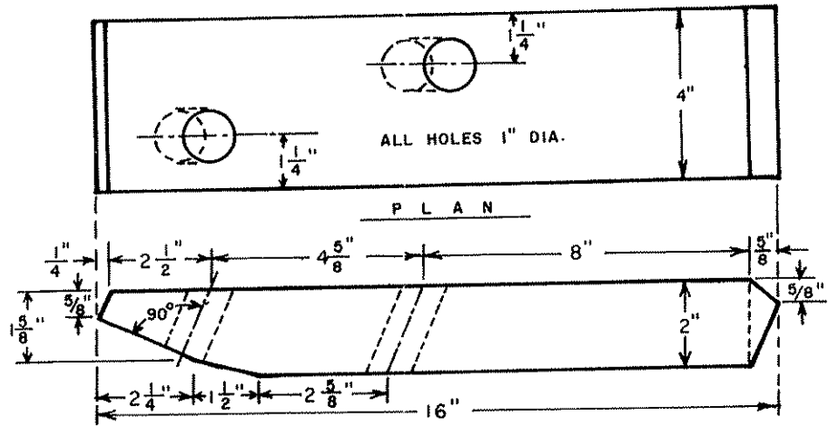
TYPICAL PLANK BLOCK



TYPICAL WOOD RAIL BRACE

NOTES:

1. Plank blocks are to conform to the dimensional specifications for wood shims (drawing 1200) contained in these standard plans except that plank blocks are to be made from hard wood with additional plate holding spike hole(s) to be bored in the field.

2. Plank blocks are to be applied directly on top of the tie beneath the rail and the tie plate and secured to the tie with spikes as required to penetrate the tie at least 4 inches.

3. When a rail is shimmed 2" or more, a combination of shims and 2" or 4" plank block must be used with the wood shims on top of the plank and secured to it as with 10d or 20d nails depending on thickness of shim.

4. When Plank blocks are used (min. length to be 36"), they are to be applied with one end flush with the end of the tie and spiked to the tie using at least four 8" Boat spikes using 5/8" diameter spike holes bored in the field.

5. If the elevation change permits, full tie length plank blocks shall be used wherever possible.

6. Wood shims not exceeding 1" in thickness may be secured using a standard 6" cut spike but shimming exceeding 1" must be secured using special 8" track spikes.

7. When a rail is shimmed more than 1 1/2" it must be securely braced at least every third tie for the full length of the shimming.

8. Braced and/or shimmed track should be checked frequently for alignment, gage, and cross level as well as to assure that the braces and/or shims are tight.

9. It should be stressed that shimming and blocking should be considered a method of last resort in correcting rail elevation mismatch problems when the track subgrade is frozen and cannot be worked.

10. Record of Shim/Block installations must be maintained in the office of Engineer of Track.

LEGEND

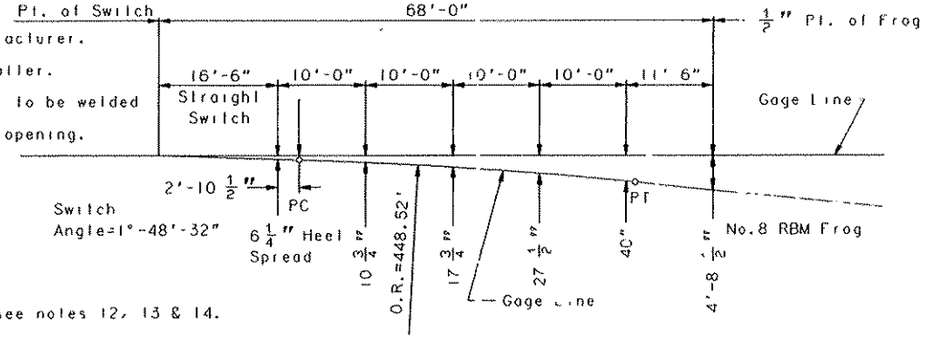
Indicates rails furnished by the manufacturer.
Indicates rails furnished by the Installer.
Indicates joints at heel of switch-not to be welded
Indicates insulated joints with 3/16" opening.
Indicates joints to be field welded.



OFFSETS FOR NO.8 R.H. TURNOUT

NOTES

1-Stock rails and switch points and all rails furnished to be fully heat treated.
2-Switch Points per A.R.E.A. Detail 5100 as shown on Plan 2104.
3-39' stock rails, to be undercut as per Plan 2104.
4-For switch details see Plan 2104.
5-Gage plate No. 1 - 6 as per Plan 2106.
6-Switch plates Nos. 0, 1, 1A ,1P and HP as per Plan 2106.
7-Turnout plates, No. 2 thru No. 12, as per Plan 2340.
8 Vertical insulated switch rods and adjustable rocker clips, as per Plan 2107.
9-Heel block as per Plan 2350.
10-All rails to be drilled as shown on this plan, except that first hole is not to be drilled by the manufacturer. Installer to field drill first hole when necessary.
11-All tie plates to be resiliently fastened except guard rails.
12-Two 9"x10"x13' Headblocks needed with switch stand 3' high or less, 16' long with stands over 3'.
13-Three 9"x10"x16' Headblocks needed for hand thrown switch with electric lock.
14-Two 9"x10"x12' Headblocks needed for power operated switch.
15-See Plan 2080 for Bill of Material.
16-Rail lengths are computed to allow a 1/8" gap for temporarily bolting the field joints and 3/16" gap for insulated joints. When rails are welded in the field, they must be cut to provide gaps recommended by the weld kit manufacturer.
17-Transition Plates (TR) 1:80 Cant, as per Plan 2348.

Note: For bolt lengths and quantities, see drawing No. 2502.

NOTES

1 - This plan is for use with A R E A recommended standards for 115 or 132 R E Rail
2 - Workmanship and materials, including beveling and hardening rail ends, shall be per current "A R E A Specifications" for heavy wall section frogs
3 - Groove for bond wires shall extend from end of filler block at least to the center line of second bolt hole
4 - All bolts used in construction of frog, shall be dipped immediately before applying (so that all threads are thoroughly coated) in grease.
5 - When frog is to be used in bolted track, first bolt hole to be drilled in the field by installer as shown on this plan.
6 - Casting to be explosion hardened, with toe and heel arms to be fully heat treated rail.

2 – FTR 29	
2 – FTR 31 Modified	
2 – FTR 33 Modified	

LEGEND

- Indicates rails furnished by the manufacturer.
- Indicates rails furnished by the installer.
- Indicates joints at heel of switch – not to be welded.
- Indicates insulated joints with 3/16 opening. (Bolted, Poly Type) See Note 16.
- Indicates joints to be field welded

NOTES

1 – Stock rails and switch points and all rails furnished to be fully heat treated.
2 – Switch points per A.R.E.A. detail 5100 as shown on plan 2104.
3 – 39' stock rails, to be undercut as per Plan 2104.
4 – For switch details see Plan 2104
5 – Gage plate No. 1-G as per Plan 2106.
6 – Switch plates Nos. 0, 1, 1A and 1P as per Plan 2106.
7 – Turnout plates, No. 2 thru No. 12, as per Plan 2340.
8 – Vertical insulated switch rods and adjustable rocker clips, generally as per Plan 2107.
9 – Heel block as per Plan 2350.
10 – All rails, including switch rails, to be drilled as shown on this plan, except that first hole is not to be drilled by the manufacturer. Forces designated by the Authority to field drill first hole when necessary.
11 – All tie plates to be resiliently fastened except frog tie plates and guard rails.
12 – Two 9"x 10"x 13' Headblocks needed with switch stand 3' high or less, 16' long with stands over 3'
13 – Three 9"x 10" x 16' Headblocks needed for hand thrown switch with electric lock.
14 – Two 9"x 10" x 12' Headblocks needed for power operated switch.
15 – See Plan 2100 for Bill of Material.
16 – Use bolted, poly type insulated joints except when revenue passenger service operates over joints. In that case, use bonded insulated joint plug rails and modify rail lengths accordingly
17 – Rail lengths are computed to allow a ⅛" gap for temporarily bolting of the field welded joints and 3/16" gap for insulated joints. When rails are welded in the field, they must be cut to provide gaps recommended by the weld kit manufacturer.

LONG TIMBERS REQUIRED

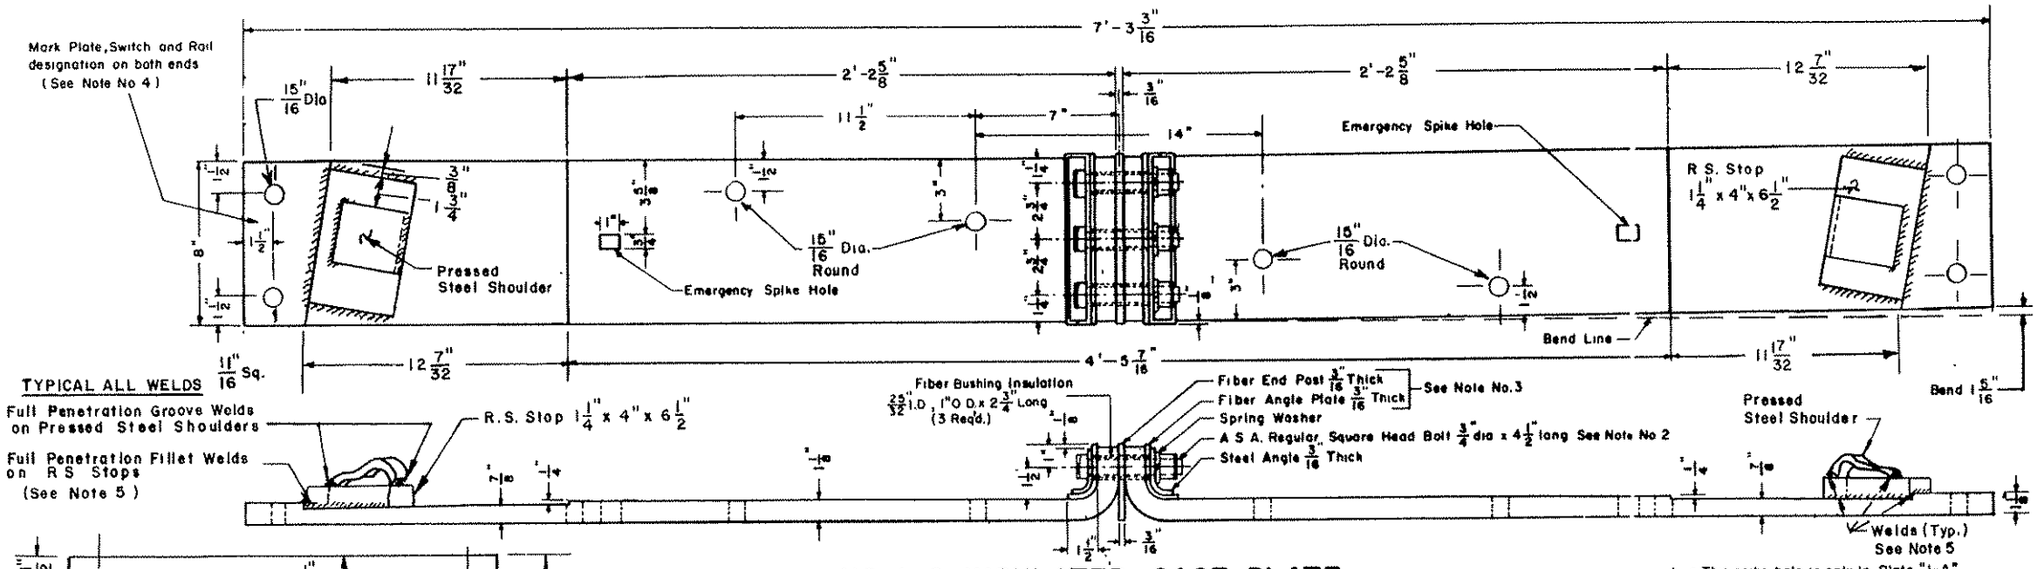
FOR 115 LB. OR 132 LB. R.E. RAIL

John B. Ray
SECTION CHIEF



NOTES

1 - Switch Plates shall conform to current A R E A Specifications for Low-Carbon Steel Tie Plates, with copper.

2 - All gage plate bolts shall have A S A Regular square heads and A S A Heavy square nuts. All bolts shall be carbon-steel with medium-carbon steel nuts and conform to current A R E A "Specifications for Heat-Treated Carbon-Steel Track Bolts and Carbon Steel Nuts."

3 - All fiber parts shall conform to current A A R Signal Section Manual, Part 58, Specification No. 13 for "Hard Fiber" and A A R Signal Section Manual, Part No. 178 covering "Requisites for Fabricated Fiber Parts for Track Insulation."

4 - Each plate shall be marked by deeply cut characters, not less than one half inch high, in the position as indicated on this plan, with the plate, switch and rail designations Example 1-P, 16-6, 132

5 - Welds shall be made so they do not interfere with the installation of resilient fasteners, rail braces and rail.

6 - Modify contour of pressed steel shoulders or, use shims on plates 2 and 3 to maintain uniform toe pressure from the resilient fasteners.

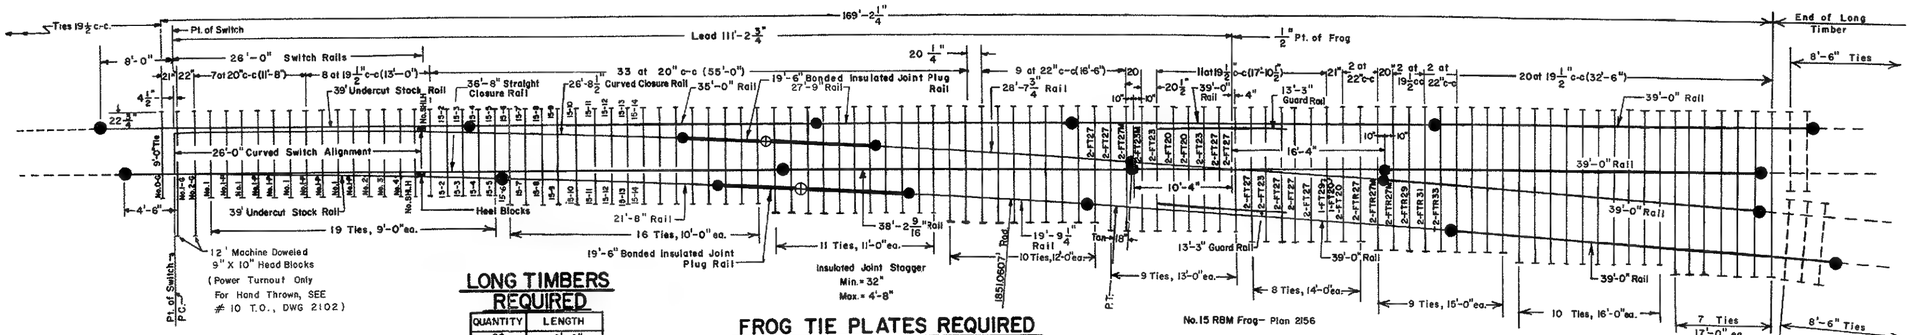
OFFSETS FOR NO. 15 TURNOUT

115 OR 132 R.E. RAIL-UNDERCUT

John D. Ray — ENGINEERING OFFICER

CHIEF ENGINEERING OFFICER



NOTES

1 – Stock rails and switch points and all rails furnished with the turnout to be fully heat treated.
2 – Switch Points per A.R.E.A. Detail 5100 as shown on plan 2155.
3 – 39' stock rails, to be undercut as per Plan 2155.
4 – For switch detail see Plan 2155.
5 – Gage plates O-G, I-G and 2-G as per Plan 2157.
6 – Switch plates Nos. I and I-P as per Plan 2157.
7 – Turnout plates, No. 2 thru No. 14 as per Plan 2340
8 – Vertical insulated switch rods and adjustable rocker clips, generally as per Plan 2158.
9 – Heel block, as per Plan 2350.
10 – All rails, including switch rails, to be drilled as shown on this plan, except that first hole is not to be drilled by the manufacturer. Forces, designated by the Authority, are to drill the first hole when necessary.
11 – All tie plates to be resiliently fastened, except, frog tie plates and guard rails.
12 – Rail lengths are computed to allow a 1/8" gap for temporarily bolting of the field welded joints and 3/16" gap for insulated joints. When rails are welded in the field, they must be cut to provide gaps recommended by the weld kit manufacturer.

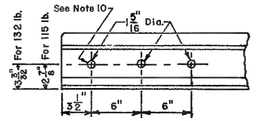
- Indicates Factory Assembled Bonded Insulated Joint Plug Rail.



RAIL END DRILLING

NOTES

1– Stock rails, switch rails and all rail furnished with the turnout to be fully heat treated.
2– Switch Points per A.R.E.A. Detail 5100 as shown on plan 2155.
3– 39' stock rails are to be undercut as shown on this plan.
4– Gage plates 0-G, 1-G and 2-G as per plan 2157.
5– Switch plates Nos. 1 and 1-P as per plan 2157.
6– For turnout plates behind heel, see Plan 2340.
7– Vertical insulated switch rods and adjustable rocker clips generally as per plan 2158.
8– Heel blocks as per Plan 2350.
9– For switch details, see Plan 2155, modified as indicated for an equilateral.
10– All rails, including switch rails, to be drilled as shown on this sheet, except that the first hole is not to be drilled by the manufacturer. Installer to field drill first hole when necessary.
11– See Plan 2150 for bill of materials.
12– All tie plates to be resiliently fastened except frog tie plates and guard rails.
13– Rail lengths are computed to allow a 1/8" gap for temporarily bolting of the field welded joints and a 5/16" gap for insulated joints. When rails are welded in the field, they must be cut to provide gaps recommended by the weld kit manufacturer.

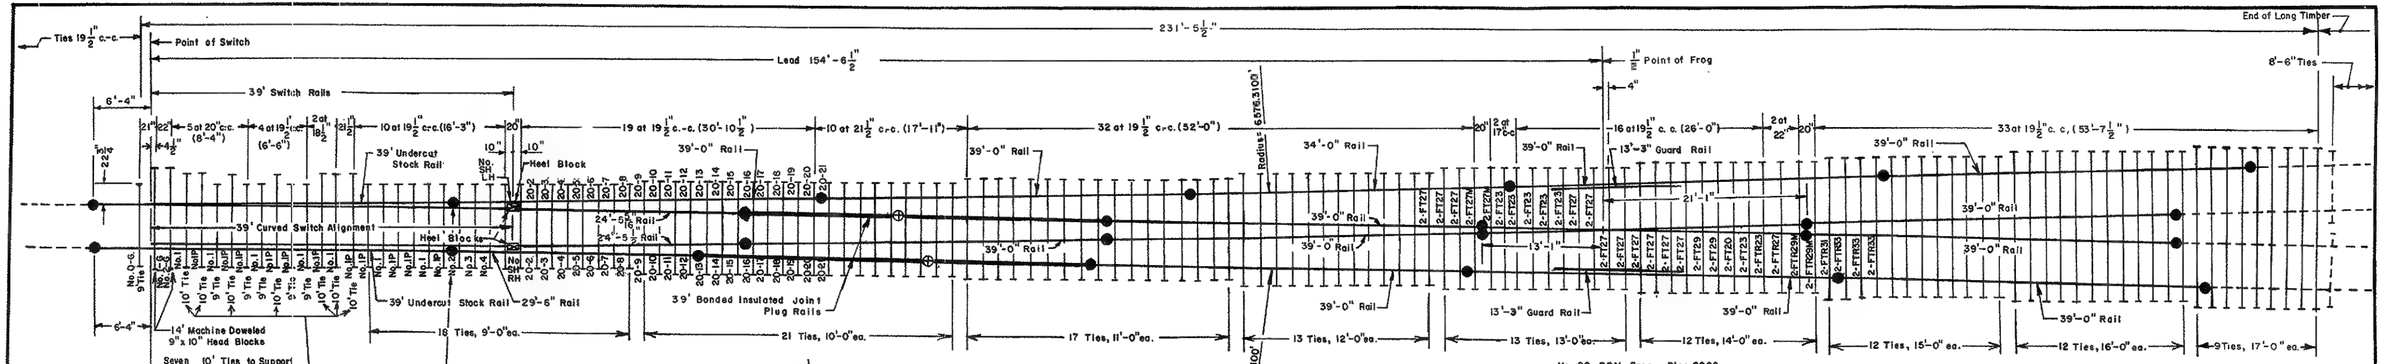
OFFSETS FOR NO. 20 TURNOUT

115 OR 132 R.E. RAIL - UNDERCUT

John D. Ray
ENGINEERING OFFICER

CHIEF ENGINEERING OFFICER



NOTES

1- Stock rails, switch rails and all rail furnished with the turnout to be fully heat treated.

2- Switch Points per A.R.E.A. Detail 5100 as shown on dwg. 2205.

3- 39' stock rails are to be undercut as shown on this plan.

4- Gage plates O-G, 1-G and 2-G as per plan 2207.

5- Switch plates Nos. 1 and 1-P as per plan 2207.

6- For turnout plates behind heel, see Plan 2340.

7- Vertical insulated switch rods and adjustable rocker clips generally as per plan 2208.

8- Heel blocks as per Plan 2350.

9- For switch details, see Plan 2205, modified as indicated for an equilateral.

10- All rails, including switch rails, to be drilled as shown on this sheet except that the first hole is not to be drilled by the manufacturer. MBTA forces to field drill first hole wher necessary.

11- See Plan 2200 for bill of materials.

12- All tie plates to be resiliently fastened, except frog tie plates and guard rails.

13- Rail lengths are computed to allow a 1/8" gap for temporarily bolting the field welded joints and 3/16" gap for insulated joints. When rails are welded in the field, they must be cut to allow gaps recommended by the weld kit manufacturer.

NOTES

1 – Stock rails and switch points and all rails furnished with the turnout are to be fully heat treated.
2 – Switch Points per A.R.E.A. Detail 5100 as shown on plan 2205.
3 – 39' stock rails, are to be undercut as per Plan 2205
4 – Gage plates O-G, I-G and 2-G as per Plan 2207
5 – Switch plates Nos. I and I-P as per Plan 2207
6 – For turnout plates behind heel, see Plan 2340.
7 – Vertical insulated switch rods and adjustable rocker clips generally as per Plan 2208
8 – Heel Blocks as per Plan 2350
9 – For switch details see Plan 2205
10 – All rails, including switch rails, to be drilled as shown on this sheet, except that first hole is not to be drilled by the manufacturer. Forces, designated by the Authority, are to drill the first hole when necessary.
11 – All tie plates to be resiliently fastened, except, frog tie plates and guard rails.
12 – See Plan 2200 for Bill of Materials.
13 – Rail lengths are computed to allow a ⅛" gap for temporarily bolting the field welded joints and a 3/16" gap for insulated joints. When rails are welded in the field, they must be cut to provide gaps recommended by the weld kit manufacturer.

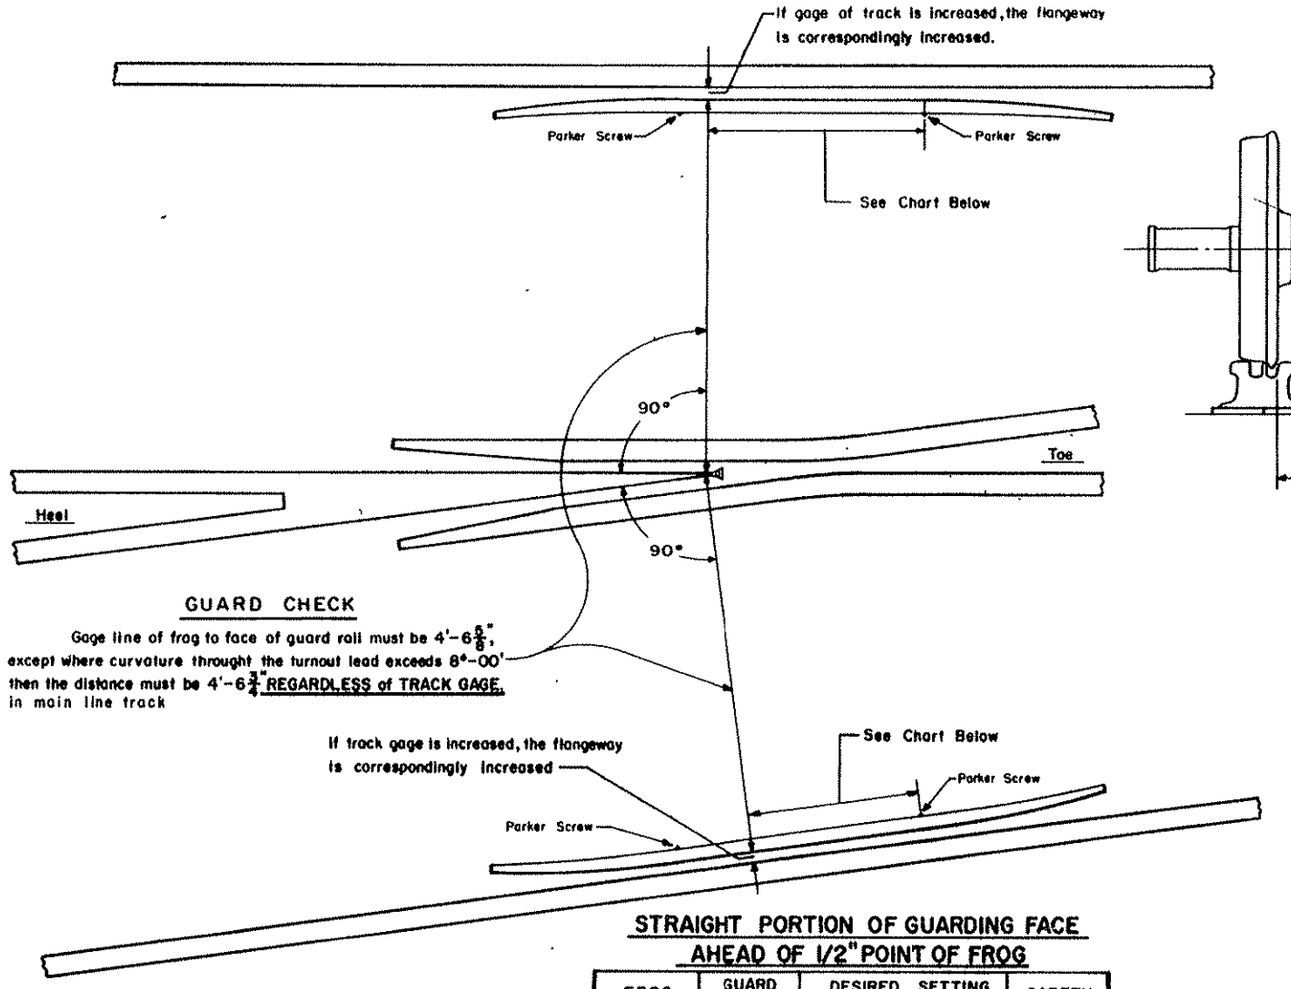
1 ISSUE NO

13'-3" MANGANESE STEEL ONE PIECE GUARD RAIL

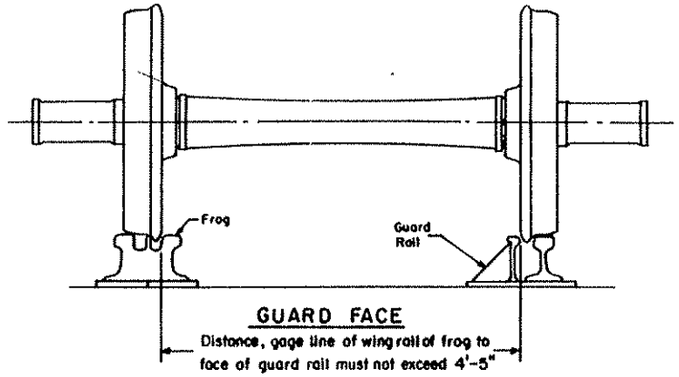
John D. Ray
ENGINEERING OFFICER

CHIEF ENGINEERING OFFICER



GUARD CHECK

Gage line of frog to face of guard rail must be $4'-6\frac{5}{8}"$, except where curvature throught the turnout lead exceeds 8°-00' then the distance must be $4'-6\frac{3}{4}"$ REGARDLESS of TRACK GAGE, in main line track



GUARD FACE

Distance, gage line of wing rail of frog to face of guard rail must not exceed 4'-5" in main line track

NOTES

1 – Guard rails must conform to MBTA Specifications for one piece manganese steel guard rails.
2 – Each tie bearing portion of the guard rails must be fully supported by a tie, which shall be kept well tamped at all times.
3 – For details of guard rails see Plan No. 2300 & 2302.
4 – Parker Screws on the back of the guard rail indicates the extent of the straight portion of the guarding face.
5 – For Additional data, See MW-1 Manual – Section 213.143

STRAIGHT PORTION OF GUARDING FACE AHEAD OF 1/2" POINT OF FROG

FROG NO.	GUARD RAIL LENGTH	DESIRED SETTING (BASED ON TIE & RAIL LAYOUT PLANS IN BOOK)	SAFETY MINIMUM
6	10'-0"		22"
8	10'-0"	$3'-7\frac{1}{4}"$	22"

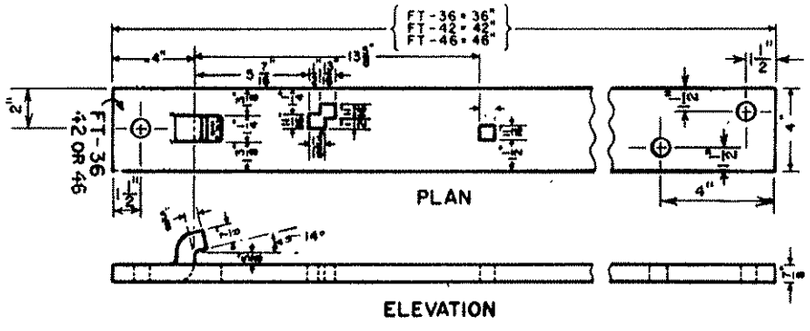
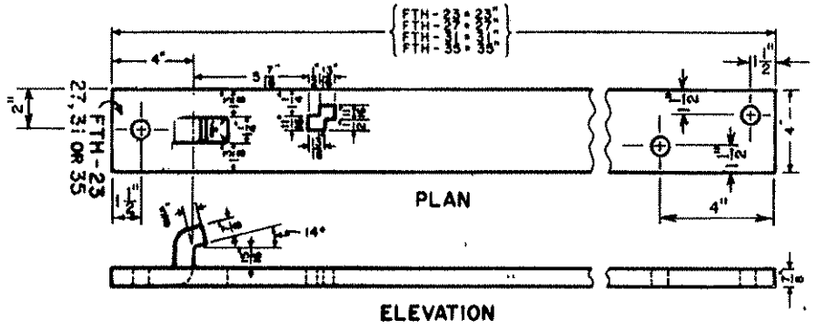
FT PLATE



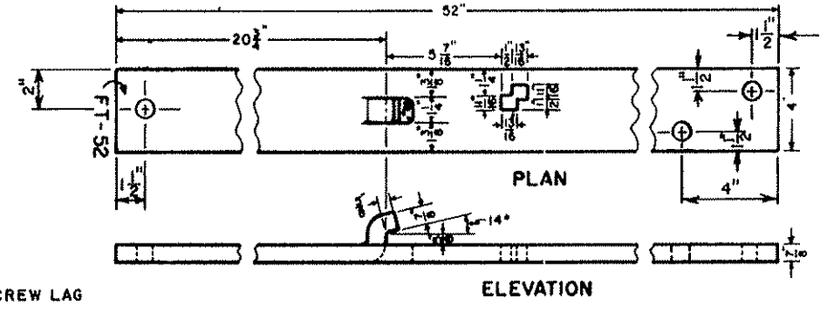
FT PLATE



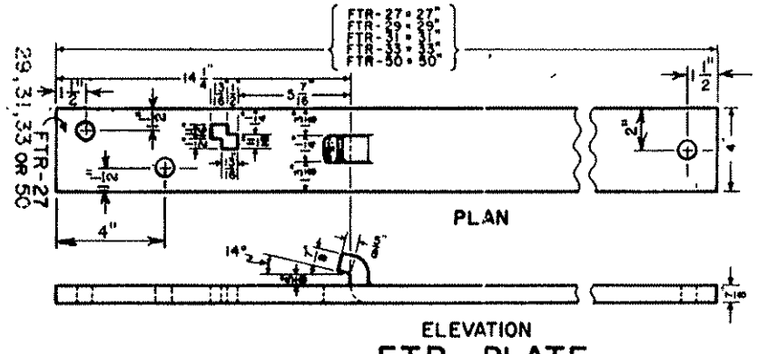
FTH PLATE

NOTE:

ALL PLATE HOLDING SCREW LAG HOLES ARE 15/16" DIA.



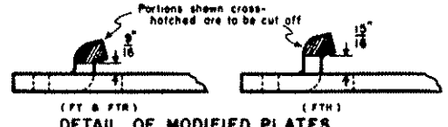
FT-52 PLATE



FTR PLATE

PLATE DESIGNATION

FT = Frog Tie Plate
FTH = Frog Tie Plate (High Hook)
FTR = Frog Tie Plate (Reverse Hook)
FT-MOD., FTH-MOD., FTR-MOD. } Modified plates will have the hook cut back as detailed below.



DETAIL OF MODIFIED PLATES

Note

Where hook on Frog Tie Plate will impinge upon base of frog or base of joint bar, the Frog Tie Plate must be modified as detailed

NOTES

Plates shall conform to the current A.R.E.A. Specifications for Low-Carbon Steel Tie Plates, with copper

Each plate shall be marked by deeply cut characters, not less than one half inch high, in the position as indicated on this plan, with the plate designation as shown

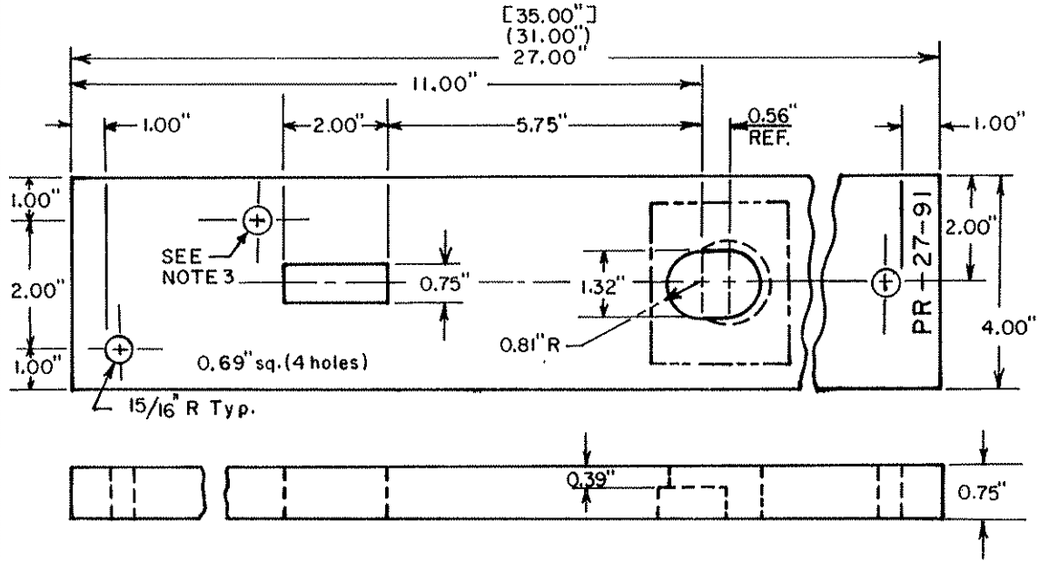
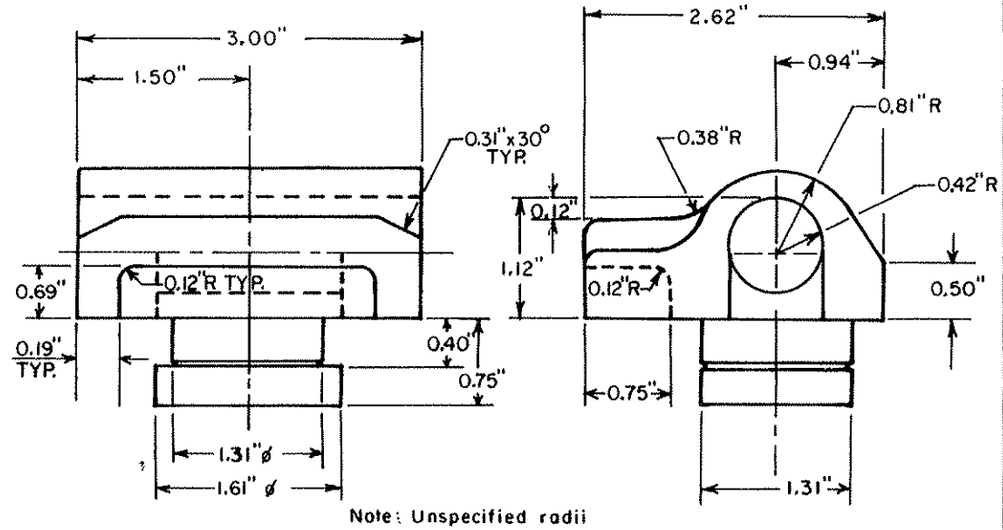
NORMAL FROG PLATE



REVERSE FROG PLATE



Note: Unspecified radii to be 0.06" max.

SWIVEL SHOULDER INSERT

NOTES:

1. Plates shown are manufactured by PANDROL, INC.
2. Material shall be Low-Carbon Steel and the plates shall conform to current A.R.E.A. specifications.
3. Furnish plates with 15/16" diameter holes for screw lags.
4. Tie plates shall be branded with a letter to designate the manufacturer, the letter 'R' when the plate is reverse shoulder, two numbers indicating the length (27", 31" or 35"), and the last two digits of the year manufactured.

* $6\frac{1}{8}$" for 132 RE rail, $5\frac{5}{8}$" for 115 RE rail.

NOTES:

1. First number in plate designation is turnout frog number, second is number of ties from heel block which counts as one.
2. Switch plates shall conform to current AREA specifications, Low-Carbon Steel Tie Plates with Copper.
3. Round holes for plate holding screw lags are 15/16" dia.
4. Rectangular holes for track spikes are 3/4" x 13/16" with 1/16" under the rail base.
5. Welds shall not interfere with the application of the resilient fasteners. Welds shall be full penetration groove welds.
6. Plates shown are for a graduated riser turnout only.
7. Variable dimensions A,B,C & L are shown on the following plan (No. 2341).
8. Each plate shall be marked with deeply cut characters not less than $\frac{1}{2}$" high, in the positions indicated on this plan.

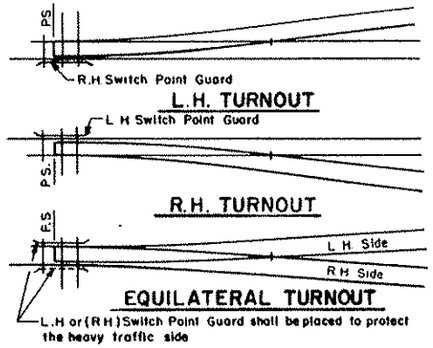
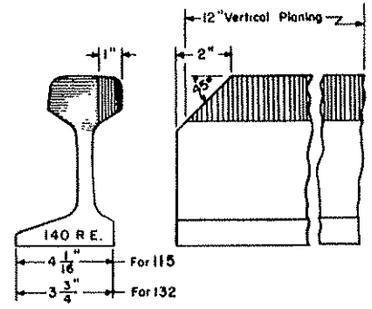
SLIDE PLATE "SP"



L.H or (R.H) Switch Point Guard shall be placed to protect the heavy traffic side

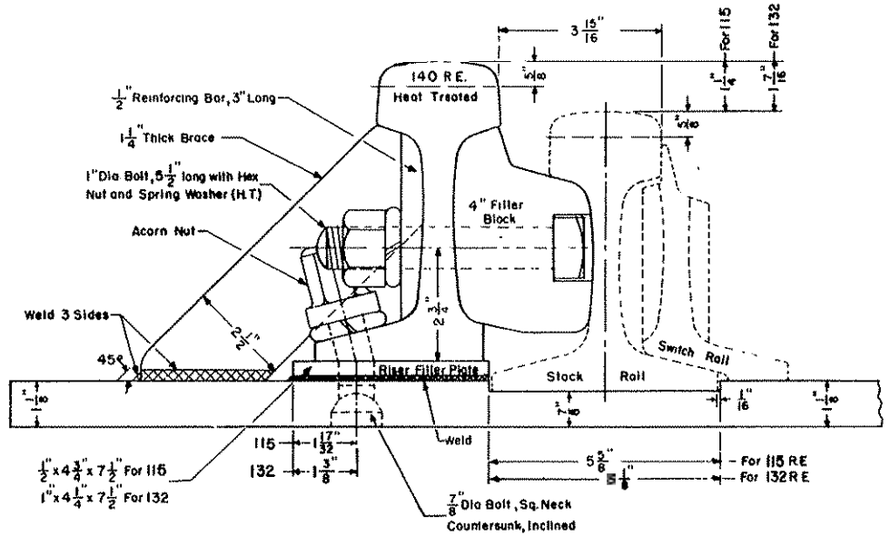
NOTE:- All switch point guards are located to protect the diverging point.

SWITCH POINT GUARD DESIGNATIONS

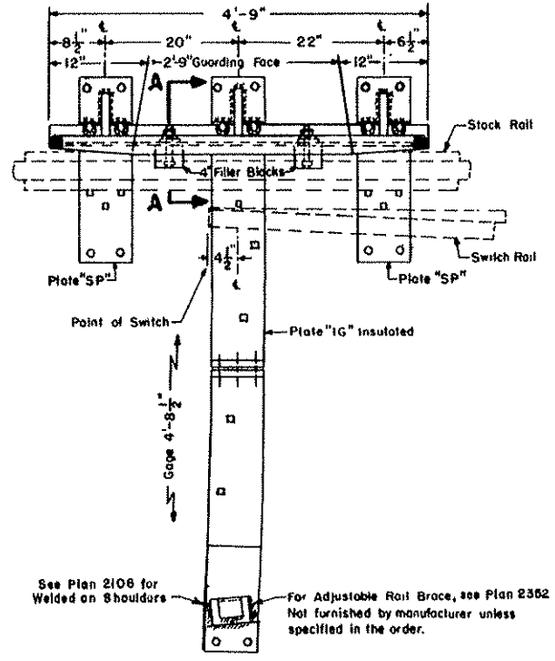


PLANING OF GUARD ENDS

Manufactured By Pettibone-Ohio
(Formerly Cleveland Frog & Crossing Co.)



SECTION A-A (TYPICAL)



PLAN

R.H. Turnout As Shown

NOTES

1 - All plates to be open hearth mild steel
2 - All guard rails heat treated and oil quenched to a Brinell Hardness of 321 to 375
3 - All plates to be stamped with plate designation and rail section The gage plate to be also stamped with hand and length of switch rail.
4 - When a non-insulated gage plate is required, the gage plate shall be furnished solid.
5 - When ordering switch point guard specify- weight of rail, length of switch rail and hand.
6 - All plate holding screw lag holes shall be 15/16" dia. to accomodate 7/8" screw lags.

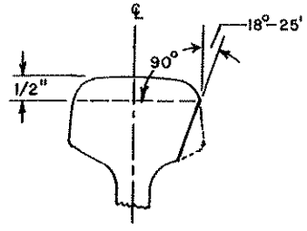
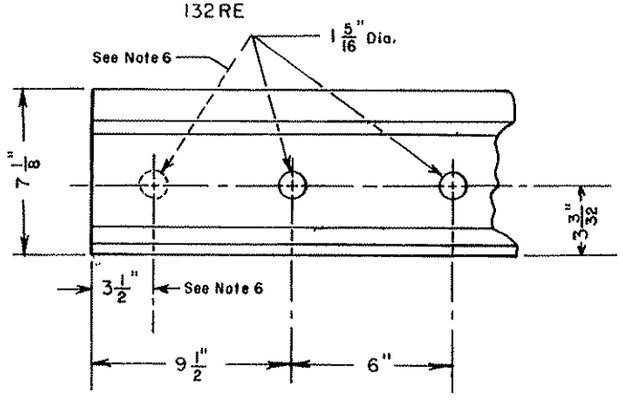
39'-0" Switch Alignment
No. 20 Turnout

BENDING OF STOCK RAILS
(See Notes 4 & 5)



DETAIL OF UNDERCUT



NOTES:

1. Rail to conform to current M B T A specifications
2. Stock rails to be fully heat treated.
3. Undercut to be on the opposite side of the rail brand.
4. Stock rails are to be bent and curved to the alignment specified on this Plan
5. Initial bend line location of stock rail will vary according to the distance the stock rail is placed ahead of the point of switch. The distance ahead of the point of switch to the end of the stock rail shall conform to MBTA Standard Plans: -

Turnout No.	Drawing No.	Switch Alignment	Stock Rails Ahead of Point	
			Straight	Curved
10	2112	16'-6"	10'-5"	14'-7½"
15	2162	26'-0"	8'-9¼"	5'-0"
20	2212	39'-0"	9'-0½"	5'-7½"

6. When stock rail ends are not to be field welded, the first bolt hole shall be drilled in the field by Installer.
7. For offsets for curving 60'-0" stock rails, see standard turnout plans. (Drawing No.'s are listed in table above.)

TYPICAL TIE LAYOUT

Notes:

1. Length of headblock timbers and orientation dependent on switch machine type and field location as affected by other adjacent special trackwork units.
2. Additional (or less) long timbers may be required depending on size and location of other adjacent special trackwork units.
3. No rail welds shall be made within limits of double slip switches. All connections shall be bolted except heel ends of end frogs may be welded.
4. Insulated joints shall be bolted "Poly" type joints.
5. Location and number of insulated joints and other rail joints to be determined on a site specific basis.

DERAIL IN "REVERSE POSITION"

NOTE:

1. Derail shall be placed a sufficient distance back from the clearance point to assure that derailed rolling equipment will not foul main or other track(s).
2. Hinged block type derails to be used only on enginehouse ready and storage tracks.
3. When ordering derail specify size:

Size	Weight of Rail
5	70 to 100 lb
6	90 to 110 lb.
7	110 to 140 lb
8	140 to 155 lb

4. Derail is to be painted yellow enamel over primer
5. All derails to accomodate padlocks on both ends, one a switch lock; the other a private lock.
6. Reflectorized derail banners shall be used where high visibility is necessary and where not prohibited by public authorities having jurisdiction.
7. Reflectorized sheeting material shall conform and be applied in accordance with current and applicable Mass. Highway Dept. Standards.
8. Banners shall be fabricated from 7 gage galvanized steel sheet. as one contiguous piece (No Joints or Seams Allowed).
9. Shade of coloration shall be approved by the MBTA or their designated agent
10. Should reflectorized material be prohibited, a red, fade resistant paint shall be applied over a rust inhibitive primer on the banner.

NOTE: The derail shown is manufactured by Western - Cullen - Hayes

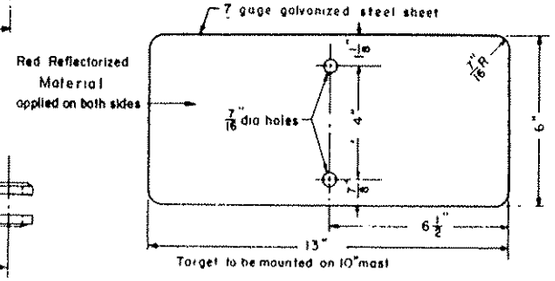
DERAIL IN "REVERSE POSITION"



TARGET DETAILS

NOTES

1 - Derail shall be placed a sufficient distance back of the clearance point to make sure that derailed rolling equipment will not foul the main or other track

2- The following switch stand is to be used to operate derail- New Century Switch Stand, Model 50-A as manufactured by Bethlehem Steel.

• Others as approved by Chief Engineering Officer.

3 - Switch stand to be in tension, with red target perpendicular to the rail, when the derail is in the normal position

4 - When ordering derail specify - Model and Size

Size 6 – for 90lb rail to 110lb rail
Size 7 – for 110lb rail to 140lb rail
Size 8 – for 140lb rail to 155 lb rail

Order derails with double ended derailing flanges which will operate as either left or right hand derails.

5 - All orders should state that derails will be operated by switch stands having a 4 3/4" throw

6 - All derails to accomodate padlocks on both ends, one a switch lock; the other a private lock.

7 - Reflectorized derail banners shall be used where high visibility is necessary and where not prohibited by public authorities having jurisdiction.

8 - Reflectorized sheeting material shall conform and be applied in accordance with current and applicable MHD Standards.

9 - Banners shall be fabricated from 7 gage galvanized steel sheet as one contiguous piece (No Joints or Seams Allowed).

10 - Shade of coloration shall be approved by the MBTA or their designated agent.

11 - Should reflectorized material be prohibited, a red, fade resistant paint shall be applied over a rust inhibitive primer on the banner

12 - All items shown for maintenance of existing equipment, only.

13 - This type of derail shall NOT be installed in new installations without the written approval of the Chief Engineering Officer of the MBTA.

NOTE: The Derail Shown is Manufactured by Western-Cullen-Hayes.

ELEVATION

NOTES:

1. Style 22 is intended for use with "run through" switches allowing automatic operation of trailing point movements through the turnout.
2. Style 22 is for use in Yard Tracks only.
3. Use good grade of engine oil, with graphite content preferred. SAE 60 FOR SUMMER, SAE 40 FOR WINTER.
4. Installation of this switch stand shall be carefully done, following the instructions of the manufacturer.
5. Paint external surfaces with bright red/orange paint over primer.

GENERAL APPLICATION

NOTES:

1. Targets shall be 7 gage Galvanized Steel Sheet.
2. All corners and edges of masts and targets shall have a smooth finish.
3. The steel surface of the targets shall be thoroughly cleaned with Oakite 33 before the application of reflectorized Scotchlite
4. Scotchlite shall be applied to both surfaces following the manufacturer's instructions completely using a heat and vacuum process.
5. Care must be exercised when sliding targets into slots and fastening them to the mast to reduce the possibility of damaging the Scotchlite material.
6. COLOR

TYPICAL SNOWMELTER LAYOUT

NOTES:

1. All mounting hardware including snap-on clips, bolts, nuts and washers shall be hot dipped galvanized or stainless steel.
2. All snowmelter elements shall be provided complete with fastening hardware.
3. For a No. 20 layout, add a crib heater in the helper rod bay and a snow melter junction box.
4. At operationally critical locations, dual switch rail and crib heaters shall be installed as directed.
5. Brackets supporting the crib heaters shall be installed 6 1/2" below the base of rail. The area under the crib heaters must be clear and sloped for drainage of the crib.

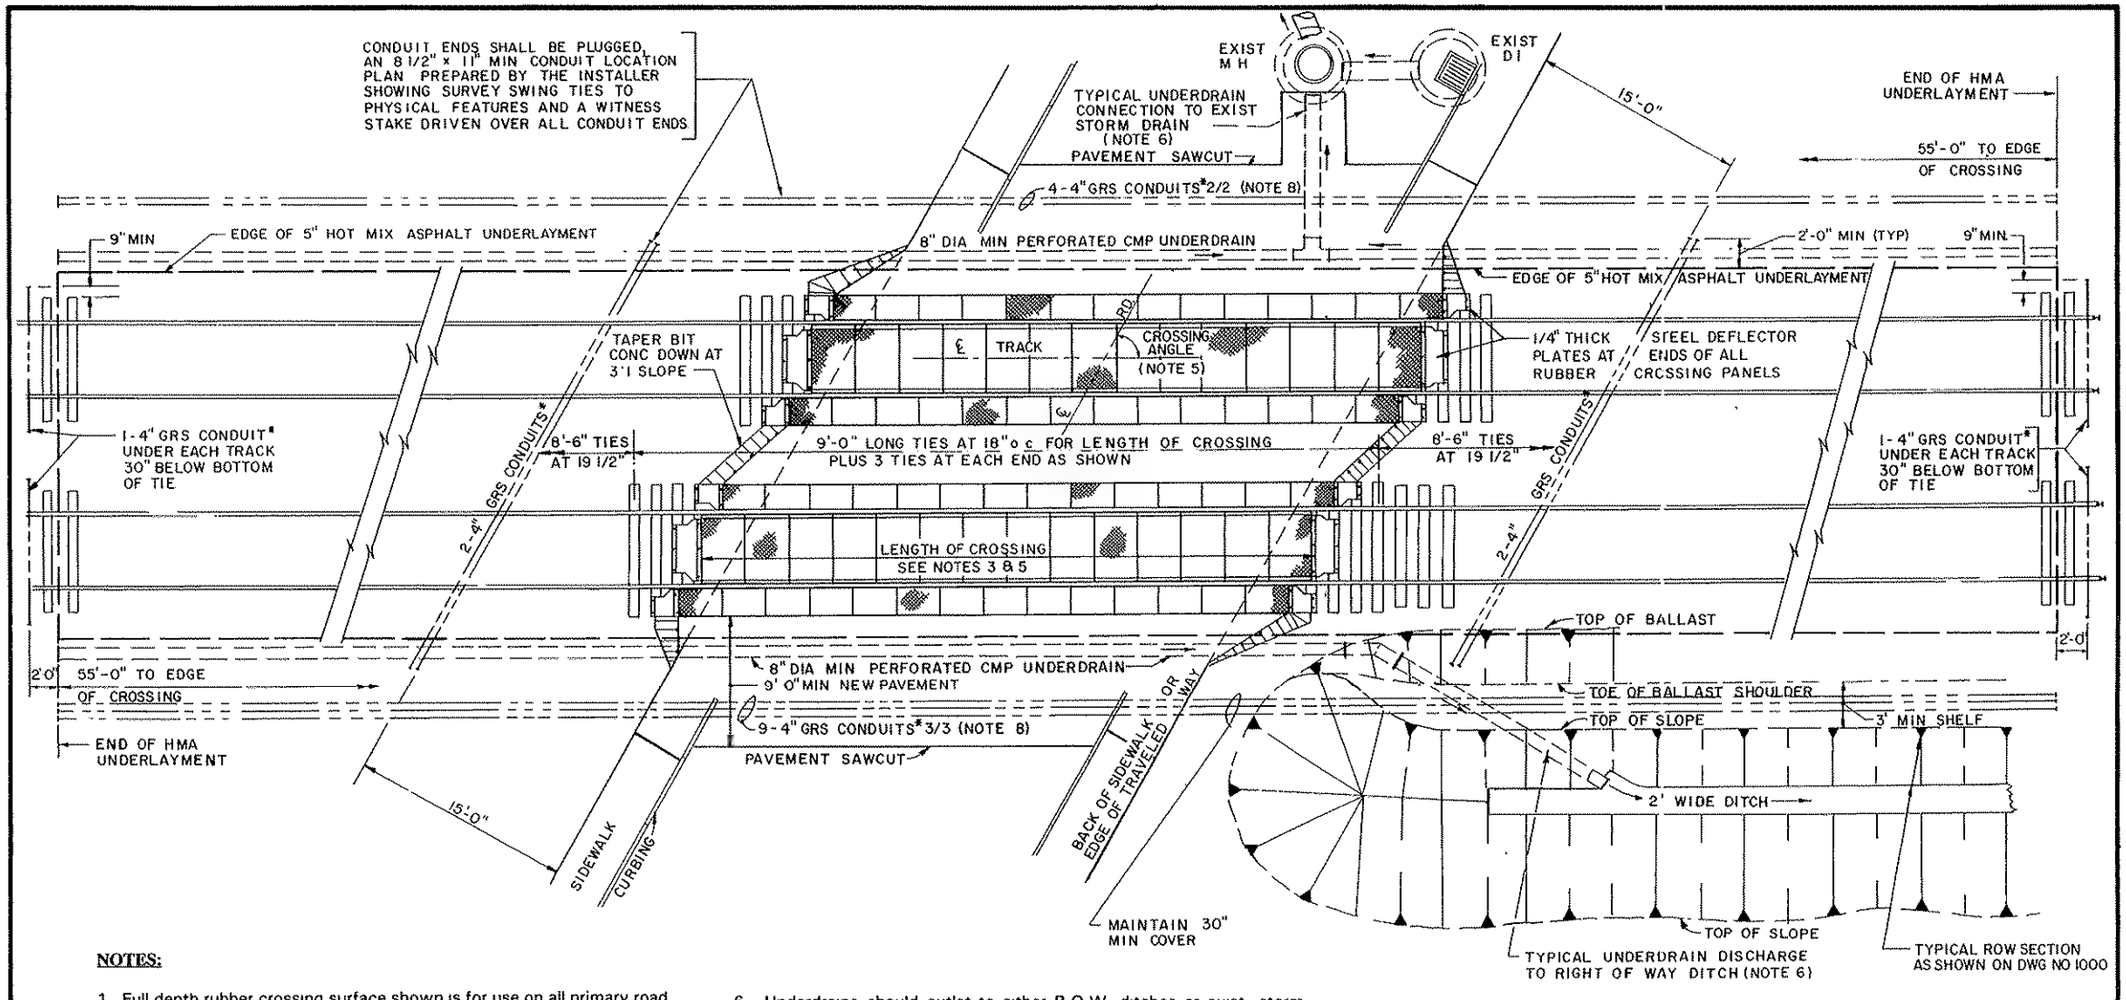
RESILIENTLY FASTENED BRIDGE GUARD RAIL

John D. Ray
SECTION CHIEF



NOTES:

1. Full depth rubber crossing surface shown is for use on all primary road crossings. Low traffic volume installations to use rubber rail seal with bituminous surface.

2. For section and additional details of full depth rubber crossing, see Dwg. No. 3106. For rubber rail seal crossing, see Dwg. No. 3108.

3. Length of crossing to be the first multiple of 3' beyond the edge of traveled way (back of sidewalk) on each end.

4. Full depth rubber crossing surfaces shall be of a design which allows installation without bolting or lagging from the top surface into the ties All crossing material must be designed to install over the standard resilient fastener system.

5. Stagger the crossing panels (as shown) in multiples of 18" (tie spacing) when the crossing angle is less than 65° ±.

6. Underdrains should outlet to either R.O.W. ditches or exist. storm drains. If either method is not possible, consider a drywell.

7. Do not use subgrade underdrains to carry water in ditches through the crossing area. Use separate storm drains for this purpose.

8. The side of R.O.W. to receive the 9 GRS conduits to be determined by Chief Engineering Officer. The 3 top conduits shall extend 10' beyond the edges of roadway, 6 bottom conduits shall extend to ends of HMA slab.

* GRS = Galvanized Rigid Steel (conduit).

NOTES:

1. Timber grade crossing is to be used as a temporary crossing only, as directed or approved by the Chief Engineer.

2. When grade crossing is removed, spike holes shall be treated and plugged.

3. When the grade crossing contains multiple tracks, the paving material between the tracks shall be approved by the Chief Engineer.

4. Standard panel lengths are 8'-0" and 6'-4 3/4". Additional lengths are attained through multiples of these basic units.

5. Crossing panels to be bored in the field to fit existing tie spacing.

6. Timber panels to be manufactured to clear resilient track fastening system. Rail clip type and/or number to be provided to grade crossing supplier.

7. Timber panels shall be treated with creosote preservative as per A.R.E.A., Chapter 3.

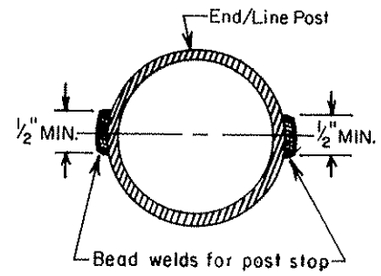
SNOW FENCES

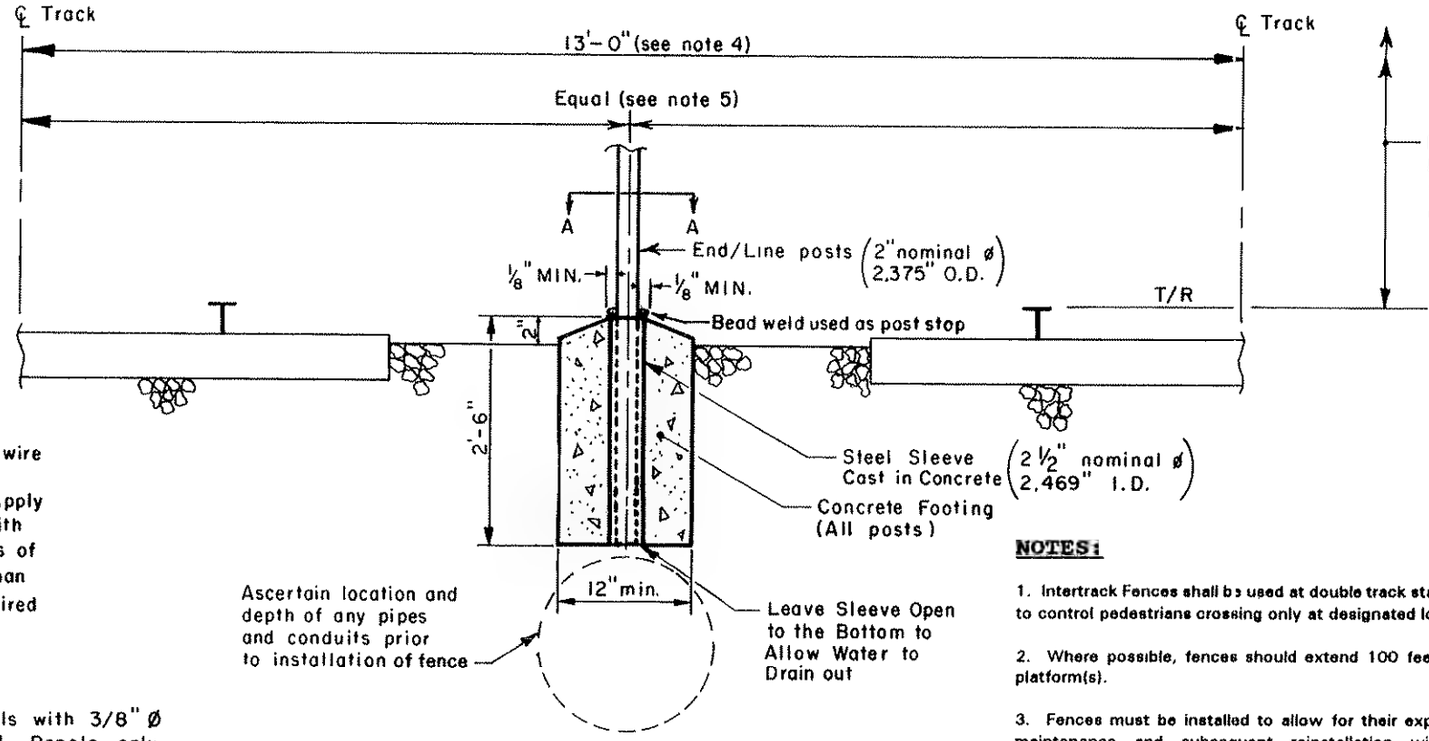
John D. Ray
ENGINEERING OFFICER

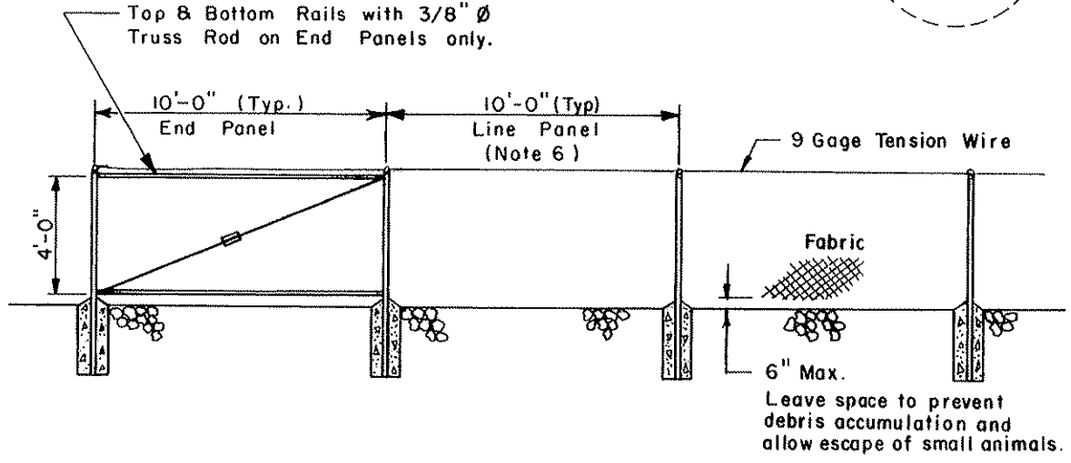
CHIEF ENGINEERING OFFICER



SECTION A-A

NOTE: Upon completion of bead welds, wire brush surface, extending into the undamaged galvanized coating. Apply Zinc-Rich paint in accordance with ASTM-A 780. Dry Film thickness of applied paint shall not be less than galvanized coating thickness required by ASTM-A 123.





NOTES:

1. Intertrack Fences shall be used at double track stations with side platforms to control pedestrians crossing only at designated locations.

2. Where possible, fences should extend 100 feet beyond the end of the platform(s).

3. Fences must be installed to allow for their expedient removal for track maintenance and subsequent reinstallation with minimum hardware replacement.

4. 13'-0" is standard tangent track spacing. Fence shall not be installed when track centers are less than 12'-5" (Tangent).

5. Fence shall be installed equidistant from the two tracks but in no case shall the distance from centerline of track to any part of the fence be less than 6'-0" (Tangent Track).

6. To discourage vaulting over the fence, do not use top rails (except at end panels).

7. Details of Fence Fabric, Posts and Hardware as per Drawing 3206.

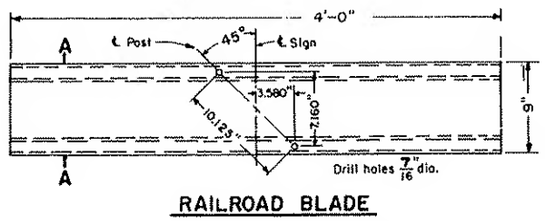
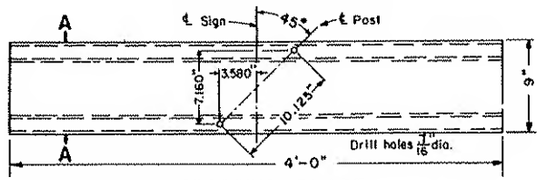
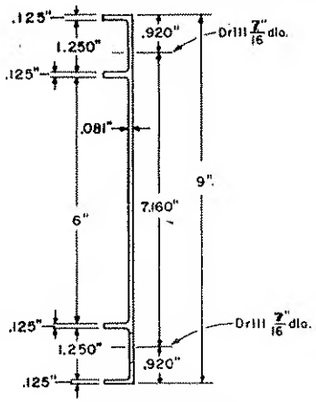
POST



RAILROAD BLADE

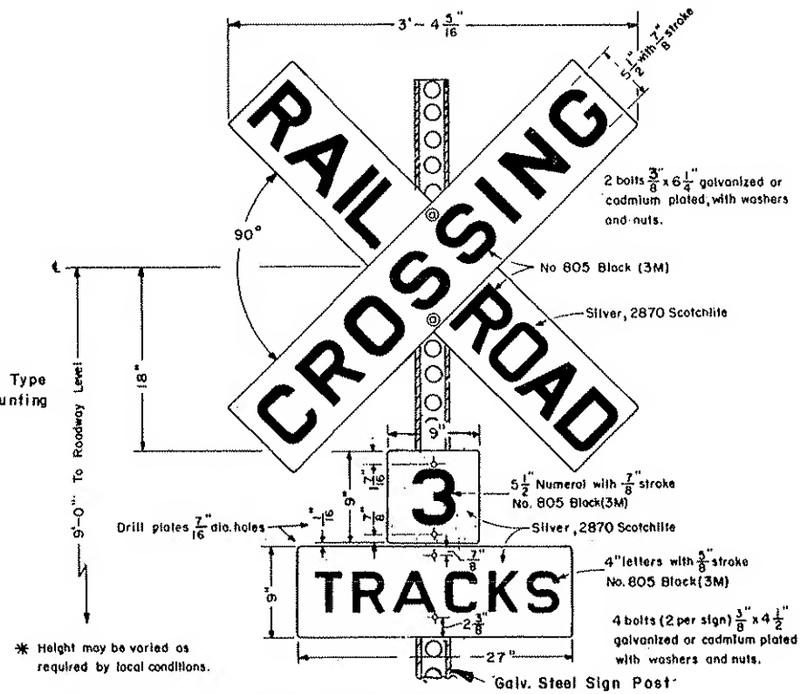


CROSSING BLADE



SECTION A-A

EXTRUDED ALUMINUM BLADES



CROSSING SIGN ASSEMBLY

NOTES

Highway Crossing Sign for use where automatic signal protection is not required.

Location - The sign shall be erected on the right hand side of the roadway on each approach to the crossing. The center line of the post shall be placed not less than 10'-6" or more than 15'-0" from the center line of the track and 6 feet from the edge of the highway shoulder or 12 feet from the edge of the traveled way in rural areas and 2 feet from the face of the curb in urban areas will usually be attainable. Where unusual conditions demand, variations determined by good judgement should provide the best possible combination of view and safety clearances attainable. The height should be 9'-0" above the roadway level to the center of the crossbuck, but may be varied to suit local conditions.

Crossbuck - The blades shall be 6063-T6 extruded aluminum. The face of the blades shall be covered with No. 2870 Silver, High Intensity Grade, Scotchlite sheeting with No. 805 Black Ink (3M) letters, or equal.

Number of Tracks Sign - The sign to be used where there are two or more tracks. The number displayed on the sign shall be the total number of tracks crossed, including sidings. Normally, where the distance between tracks, measured along the highway, exceeds 100 feet, an additional crossing sign should be erected unless local conditions require otherwise. The sign shall be .081", 6061-T6 aluminum sheet. The face of the signs shall be covered with No. 2870 Silver, High Intensity Grade, Scotchlite sheeting with No. 805 Black Ink (3M) letters, or equal.

Specifications - As per current issue of the Federal Highway Administration, Part VIII "Traffic Control Systems for Railroad Grade Crossings." The letters and numerals as per current A.A.R. Signal Section Plans 1712, 1713 and 1714.

Ordering - Specify sign complete or individual crossbuck, track sign or post, in addition the numeral for the track sign must be specified. Any modifications necessary to comply with legal requirements must be specified.
